PHASE 8 – PROJECT DEMONSTRATION

1. INTRODUCTION

The Project Demonstration phase presents the practical working of the Script-Controlled ACL – Restrict Record Access Based on Field Value project.

The demonstration is carried out using the completed ServiceNow implementation. It shows the configured user roles, Institution Details table, ACL-based access control, Branch-based Read restriction, Create, Write, Delete operations, unauthorized access restriction, and administrator access.

A screen-recording video is used as the primary demonstration evidence.

2. DEMONSTRATION OBJECTIVES

The main objectives of the demonstration are:

- To demonstrate the completed ServiceNow project.
- To show the created EEE test user.
- To demonstrate the assigned roles.
- To demonstrate the Institution Details table.
- To demonstrate Branch-based Read access.
- To demonstrate restricted access for unauthorized users.
- To demonstrate Create permission.
- To demonstrate Write permission.
- To demonstrate Delete permission.
- To demonstrate administrator full access.
- To present the final working result of the project.

3. DEMONSTRATION REQUIREMENTS

The following items are required for the demonstration:

- ServiceNow instance
- EEE test user
- Roles bb1, bb2, bb3, and bb4

•Institution Details table

•Sample records with ECE, EEE, and CSE Branch values

•Configured Read ACL

•Configured Create ACL

•Configured Write ACL

•Configured Delete ACL

•Administrator account

•Screen-recording software

4. DEMONSTRATION PROCEDURE

The demonstration is performed in the following sequence.

Step 1 – Open ServiceNow

The ServiceNow instance is opened and the completed project environment is accessed.

Step 2 – Demonstrate EEE User

The EEE test user is opened to show the created user account.

The user details include:

•User ID: EEE User

•First Name: EEE

•Last Name: User

•Email: eeeuser@gmail.com

Step 3 – Demonstrate Assigned Roles

The roles assigned to the EEE user are displayed:

•bb1

•bb2

•bb3

•bb4

These roles provide the required permissions for the different operations.

5. INSTITUTION DETAILS TABLE DEMONSTRATION

The Institution Details table is opened.

The table contains:

•Student Roll Number

•Student Name

•Faculty Name

•Branch

•Email

•Phone Number

•Description

The Branch field contains the values:

•ECE

•EEE

•CSE

Sample records are displayed to demonstrate the access-control behavior.

6. READ ACCESS DEMONSTRATION

The EEE test user is used to demonstrate Read access.

The configured Read ACL contains:

•Operation: Read

•Required role: bb1

•Data condition: Branch is EEE

The demonstration shows that the authorized user can access the permitted EEE record.

This demonstrates the Branch-based access restriction.

7. UNAUTHORIZED ACCESS DEMONSTRATION

A user without the required authorization is used to access the Institution Details table.

The system restricts the user's access and displays the appropriate security constraint.

This demonstrates that unauthorized users cannot access the protected records.

8. CREATE OPERATION DEMONSTRATION

The Create permission is demonstrated using the required bb2 role.

The New option is selected in the Institution Details table.

A new record is created to demonstrate that the authorized user can perform the Create operation.

9. WRITE OPERATION DEMONSTRATION

The Write permission is demonstrated using the required bb3 role.

An existing permitted record is opened and modified.

The Update option is used to save the changes.

This demonstrates that the authorized user can perform the Write operation.

10. DELETE OPERATION DEMONSTRATION

The Delete permission is demonstrated using the required bb4 role.

An authorized record is selected and the Delete operation is performed.

The record is removed successfully, demonstrating the configured Delete permission.

11. ADMINISTRATOR ACCESS DEMONSTRATION

The administrator account is used to access the Institution Details table.

Records from different Branch values are displayed, including:

- ECE
- EEE
- CSE

This demonstrates that the administrator retains full access to the table.

12. COMPLETE DEMONSTRATION FLOW

The demonstration video follows the sequence below:

Start

Open ServiceNow

Show EEE User

Show Assigned Roles

Open Institution Details Table

Demonstrate EEE Read Access

Demonstrate Unauthorized Access Restriction

Demonstrate Create Operation

Demonstrate Write Operation

Demonstrate Delete Operation

Demonstrate Administrator Access

Show Final Result

End

13. DEMONSTRATION VIDEO

https://drive.google.com/file/d/1xOY27v22GlCW7qwuaGlfOKJRLJY_gbHB/view?usp=sharing

- User and role configuration
- Institution Details table
- Branch-based Read access
- Unauthorized access restriction
- Create operation
- Write operation
- Delete operation

•Administrator access

14. DEMONSTRATION RESULT

The demonstration verifies the following access behavior:

Operation	Demonstration Result
Read	EEE record accessible according to the configured condition
Unauthorized Access	Access restricted
Create	Record creation permitted
Write	Record modification permitted
Delete	Record deletion permitted
Administrator	Full access available

The demonstrated results are consistent with the completed project testing.

15. DEMONSTRATION EVIDENCE

The demonstration video is the primary evidence for Phase 8.

No additional screenshots are required for this phase when the complete screen-recording clearly demonstrates all required operations.

The video should be submitted along with the project documentation according to the college submission requirements.

16. PROJECT OUTCOME

The demonstration successfully presents the completed ServiceNow ACL implementation.

The project demonstrates:

•Role-based access control.

•Branch-based Read restriction.

•Create permission control.

•Write permission control.

•Delete permission control.

•Unauthorized access restriction.

•Administrator full access.

17. CONCLUSION

The Project Demonstration phase provides a practical presentation of the completed ScriptControlled ACL – Restrict Record Access Based on Field Value project.

The screen-recording demonstrates the complete workflow of the system, from user and role configuration to record access and ACL-controlled operations.

The demonstration confirms that the implemented ServiceNow ACL configuration provides the required access control for the Institution Details table and completes the project successfully.
